

L03Contribution Journal_FA26_ML_6171_16347_4_ITAI1371

Diane Lenhoff

I worked through the entire notebook and completed the required code, activities, and analysis sections. I ran the code as I went and reviewed the outputs to make sure everything was working correctly.

I worked with my team members to discuss the different machine learning concepts and models. We helped each other when we had questions or problems with the code.

I also completed the reflection questions based on what I learned from the lab. I also coordinated the team submission by collecting everyone's contributions, making sure all required parts were included, and putting together for Lab 02, the final Team lab, Consolidated Team Contribution Reflective Journal and Contribution Journal for submission.

L03 Contribution Journal

I started by running all 25 cells in Colab and followed the full workflow. It started with data loading, exploratory data analysis, train/test split, training, then evaluation. I then recorded the baseline results, with Logistic Regression at 88.9% and the Decision Tree at 83.3%.

In Task 1, I replaced the placeholder features with features of my choosing, which were magnesium, flavanoids, and alcohol. The results were 94.4%, beating the four-feature baseline. I picked these features because magnesium and flavanoids weren't in the baseline set and I kept alcohol from the original set for comparison. In Part 8, I worked through five learning scenarios, classifying each as supervised, unsupervised, or reinforcement, then checked my answers against the answer key. In the Reflection cell, I described the three learning types in my own words, the wine analysis, a real-world application of supervised learning, and then key learnings. Lastly, I ran the notebook to ensure reproducibility, exported it to PDF, then wrote my reflective journal and this contribution journal.

ITAI 1371

For my contribution to the project this week, I worked through all 25 of the cells, studying each step to understand the material and taking notes on any information when needed. This was to ensure that I took time to look through all the outputs to understand the reasoning behind certain steps in the workflow. I made sure to complete the lab by answering all the questions at the end to the best of my ability. Lastly, I wrote about my learning experience in detail in my reflection journal and turned in the documents in time.

KeiChara Fleeks-Jones

Contribution Journal

My contribution to the lab and group was ensuring that I followed all of the steps for the assignment and working through the lab, answering questions and performing research when needed for a better understanding of what I was working on. I chose to explore machine learning in education for the real world application example because I am genuinely interested in how to help students succeed, especially those with learning disabilities.
